LAB REPORT

On

ANALYSIS AND DESIGN OF ALGORITHMS (23CS4PCADA)

Submitted by

BASAVESH V KINAGI(1BM24CS067)

in partial fulfillment for the award of the degree of

BACHELOR OF ENGINEERING

in

COMPUTER SCIENCE AND ENGINEERING

B. M. S. COLLEGE OF ENGINEERING

(Autonomous Institution under VTU)

BENGALURU - 560019

February to June 2026

CERTIFICATE

**B. M. S. College of Engineering,
Bull Temple Road, Bangalore - 560019
(Affiliated To Visvesvaraya Technological University, Belgaum)
Department of Computer Science and Engineering**

This is to certify that the Lab work entitled “**ANALYSIS AND DESIGN OF ALGORITHMS**” carried out by Basavesh Kinagi(1BM24CS067), who is bonafide student of **B. M. S. College of Engineering**. It is in partial fulfillment for the award of **Bachelor of Engineering in Computer Science and Engineering** of the Visvesvaraya Technological University, Belgaum during the year 2025-26. The Lab report has been approved as it satisfies the academic requirements in respect of Analysis and Design of Algorithms Lab - **(23CS4PCADA)** work prescribed for the said degree.

Pallavi C V

Assistant Professor

Index Sheet

Sl. No.	Experiment Title	Page No.
1	Write program to obtain the Topological ordering of vertices in a given digraph.	1-3
2	Implement Johnson Trotter algorithm to generate permutations.	4-7
3	Sort a given set of N integer elements using Merge Sort technique and compute its time taken. Run the program for different values of N and record the time taken to sort.	8-10
4	Sort a given set of N integer elements using Quick Sort technique and compute its time taken.	11-13
5	Sort a given set of N integer elements using Heap Sort technique and compute its time taken.	14-16
6	Implement 0/1 Knapsack problem using dynamic programming. (5 Marks)	17-19
7	Implement All Pair Shortest paths problem using Floyd's algorithm.	20-21
8	(a) Find Minimum Cost Spanning Tree of a given undirected graph using Prim's algorithm. (b) Find Minimum Cost Spanning Tree of a given undirected graph using Kruskal's algorithm.	22-28
9	Implement Fractional Knapsack using Greedy technique.	29-30
10	From a given vertex in a weighted connected graph, find shortest paths to other vertices using Dijkstra's algorithm.	31-33
11	Implement "N-Queens Problem" using Backtracking.	34-37
12	All Leetcode questions	38-50

Course outcomes:

CO1	Analyze time complexity of algorithms using asymptotic notations.
CO2	Apply various algorithm design techniques for the given problem.
CO3	Evaluate the appropriate algorithm/design technique for solving a given problem.
CO4	Conduct practical experiments by applying appropriate algorithm design technique to solve problems.

Lab Program 1: Topological Sorting

Write program to obtain the Topological ordering of vertices in a given digraph.

```
#include <stdio.h>

#define MAX 100

void topological(int adj[MAX][MAX], int n)
{
    int indeg[MAX] = {0};
    int topo[MAX];
    int queue[MAX];
    int front = 0, rear = -1;
    int count = 0;

    for (int i = 0; i < n; i++)
    {
        for (int j = 0; j < n; j++)
        {
            if (adj[i][j] == 1)
                indeg[j]++;
        }
    }

    for (int i = 0; i < n; i++) {
        if (indeg[i] == 0)
            queue[++rear] = i;
    }

    while (front <= rear)
    {
        int u = queue[front+

```

```

+]; topo[count++] = u;

for (int j = 0; j < n; j++)
    { if (adj[u][j] == 1) {
        indeg[j]--;
        if (indeg[j] == 0) queue[+
            +rear] = j;
        }
    }
}

if (count != n)
    printf("Topological ordering not possible (Graph has cycle)\n");
else {
    for (int i = 0; i < count; i++)
        { printf("%d", topo[i]);
            if (i != count - 1)
                printf(" -> ");
        }
    }
}

```

```

int main()
{ int n;
  int adj[MAX][MAX];

  printf("Enter number of vertices: ");
  scanf("%d", &n);

```

```

printf("Enter adjacency matrix elements:\n");

for (int i = 0; i < n; i++) {
    for (int j = 0; j < n; j++)
        { scanf("%d", &adj[i][j]);
        }
    }

topological(adj, n);

return 0;
}

```

Output:

```

Enter number of vertices: 6
Enter adjacency matrix elements:
0 1 1 0 0 0
0 0 0 1 1 0
0 0 0 1 0 0
0 0 0 0 0 1
0 0 0 0 0 1
0 0 0 0 0 0
0 -> 1 -> 2 -> 4 -> 3 -> 5
Process returned 0 (0x0)   execution time : 85.423 s
Press any key to continue.

```

Lab Program 2: Johnson-Trotter Algorithm

Implement Johnson Trotter algorithm to generate permutations.

```
#include <stdio.h>
```

```
int a[20], dir[20], n;
```

```
void print()
```

```
{  
    for(int i = 0; i < n; i++)  
        printf("%d ", a[i]);  
    printf("\n");  
}
```

```
int getMobile()
```

```
{  
    int mobile = 0, pos = -1;  
  
    for(int i = 0; i < n; i++)  
    {  
        if(dir[i] == -1 && i != 0 && a[i] > a[i-1] && a[i] > mobile)  
        {  
            mobile = a[i];  
            pos = i;  
        }  
  
        if(dir[i] == 1 && i != n-1 && a[i] > a[i+1] && a[i] > mobile)  
        {  
            mobile = a[i];  
            pos = i;  
        }  
    }  
}
```

```

    }
}

return pos;
}

void generatePermutations()
{
    int mobilePos, mobile;

    print();

    while(1)
    {
        mobilePos = getMobile();

        if(mobilePos == -1)
            break;

        mobile = a[mobilePos];

        if(dir[mobilePos] == -1)
        {
            int temp = a[mobilePos];
            a[mobilePos] = a[mobilePos-1];
            a[mobilePos-1] = temp;

            temp = dir[mobilePos];
            dir[mobilePos] = dir[mobilePos-1];
            dir[mobilePos-1] = temp;

```

```

        mobilePos--;
    }
    else
    {
        int temp = a[mobilePos];
        a[mobilePos] = a[mobilePos+1];
        a[mobilePos+1] = temp;

        temp = dir[mobilePos];
        dir[mobilePos] = dir[mobilePos+1];
        dir[mobilePos+1] = temp;

        mobilePos++;
    }

    for(int i = 0; i < n; i++)
    {
        if(a[i] > mobile)
            dir[i] = -dir[i];
    }

    print();
}

int main()
{
    printf("Enter value of n: ");
    scanf("%d", &n);

```

```
for(int i = 0; i < n; i++)  
{  
    a[i] = i + 1;  
    dir[i] = -1;  
}  
  
generatePermutations();  
  
return 0;  
}
```

Output:

```
Enter value of n: 3  
1 2 3  
1 3 2  
3 1 2  
3 2 1  
2 3 1  
2 1 3  
  
Process returned 0 (0x0)    execution time : 2.667 s  
Press any key to continue.
```

Lab Program 3: Merge Sort

Sort a given set of N integer elements using Merge Sort technique and compute its time taken.

```
#include <stdio.h>
```

```
#include <time.h>
```

```
void merge(int arr[], int low, int mid, int high)
```

```
{
```

```
    int i, j, k;
```

```
    int temp[10000];
```

```
    i = low;
```

```
    j = mid + 1;
```

```
    k = low;
```

```
    while(i <= mid && j <= high)
```

```
    {
```

```
        if(arr[i] <= arr[j])
```

```
            temp[k++] = arr[i++];
```

```
        else
```

```
            temp[k++] = arr[j++];
```

```
    }
```

```
    while(i <= mid)
```

```
        temp[k++] = arr[i++];
```

```
    while(j <= high)
```

```
        temp[k++] = arr[j++];
```

```
    for(i = low; i <= high; i++)
```

```
        arr[i] = temp[i];
```

```
}
```

```

void mergeSort(int arr[], int low, int high)
{
    if(low < high)
    {
        int mid = (low + high) / 2;

        mergeSort(arr, low, mid);
        mergeSort(arr, mid + 1, high);

        merge(arr, low, mid, high);
    }
}

```

```

int main()
{
    int n;
    int arr[10000];

    printf("Enter number of elements: ");
    scanf("%d", &n);

    printf("Enter elements:\n");
    for(int i = 0; i < n; i++)
        scanf("%d", &arr[i]);

    clock_t start, end;

    start = clock();

    mergeSort(arr, 0, n - 1);

All Leetcode Problems:

Leetcode 207: Course Schedule

There is a total of numCourses courses you have to take, labeled from 0 to numCourses - 1. You are given an array prerequisites where prerequisites[i] = [a_i, b_i] indicates that you must take course b_i first if you want to take course a_i. For example, the pair [0, 1], indicates that to take course 0 you have to first take course 1. Return true if you can finish all courses. Otherwise, return false.

Example 1:

Input: numCourses = 2, prerequisites = [[1,0]]

Output: true

Explanation: There is a total of 2 courses to take. To take course 1 you should have finished course 0. So, it is possible.

Example 2:

Input: numCourses = 2, prerequisites = [[1,0], [0,1]]

Output: false

Explanation: There is a total of 2 courses to take. To take course 1 you should have finished course 0, and to take course 0 you should also have finished course 1. So, it is impossible.

Solution:

```
bool canFinish(int numCourses, int** prerequisites, int prerequisitesSize, int* prerequisitesColSize)
```

```
{ int graph[2000][2000] = {0};
```

```
int indegree[2000] = {0};
```

```
int queue[2000];
```

```
int front = 0, rear = -1;
```

```
int i, count = 0;
```

```
for(i = 0; i < prerequisitesSize; i++)
```

```
{ int a = prerequisites[i][0];
```

```
int b = prerequisites[i][1];
```

```

graph[b][a] = 1;
indegree[a]++;
}

for(i = 0; i < numCourses; i++)
{ if(indegree[i] == 0) {
    queue[++rear] = i;
  }
}

while(front <= rear) {
    int u = queue[front++];
    count++;

    for(i = 0; i < numCourses; i++)
    { if(graph[u][i] == 1) {
        indegree[i]--;

        if(indegree[i] == 0)
        { queue[++rear] = i;
        }
      }
    }
}

return count == numCourses;
}

```

Output:

207. Course Schedule

There are a total of `numCourses` courses you have to take, labeled from `0` to `numCourses - 1`. You are given an array `prerequisites` where `prerequisites[i] = [ai, bi]` indicates that you **must** take course `bi` first if you want to take course `ai`.

- For example, the pair `[0, 1]`, indicates that to take course `0` you have to first take course `1`.

Return `true` if you can finish all courses. Otherwise, return `false`.

Example 1:

Input: `numCourses = 2, prerequisites = [[1,0]]`
Output: `true`
Explanation: There are a total of 2 courses to take. To take course 1 you should have finished course 0, so it is possible.

Example 2:

Input: `numCourses = 2, prerequisites = [[1,0],[0,1]]`
Output: `false`
Explanation: There are a total of 2 courses to take. To take course 1 you should have finished course 0, and to take course 0 you should also have finished course 1, so it is impossible.

Code

```
1 bool canFinish(int numCourses, int** prerequisites, int prerequisitesSize, int* prerequisitesColSize)
2 {
3     int* indegree[numCourses];
4     int adj[numCourses][numCourses];
5     int adjSize[numCourses];
6
7     for(int i = 0; i < numCourses; i++)
8     {
```

Test Result

Accepted Runtime: 11ms

Case 1 **Case 2**

Input

`numCourses =`
`2`

`prerequisites =`
`[[1,0]]`

Output

`true`

Minimum swap:

You are given two integer arrays of the same length `nums1` and `nums2`. In one operation, you are allowed to swap `nums1[i]` with `nums2[i]`.

- For example, if `nums1 = [1,2,3,8]`, and `nums2 = [5,6,7,4]`, you can swap the element at `i = 3` to obtain `nums1 = [1,2,3,4]` and `nums2 = [5,6,7,8]`.

Return *the minimum number of needed operations to make* `nums1` *and* `nums2` **strictly increasing**. The test cases are generated so that the given input always makes it possible.

An array `arr` is **strictly increasing** if and only if `arr[0] < arr[1] < arr[2] < ... < arr[arr.length - 1]`.

Example 1:

Input: `nums1 = [1,3,5,4]`, `nums2 = [1,2,3,7]`

Output: 1

Explanation:

Swap `nums1[3]` and `nums2[3]`. Then the sequences are:

`nums1 = [1, 3, 5, 7]` and `nums2 = [1, 2, 3, 4]`

which are both strictly increasing.

Example 2:

Input: `nums1 = [0,3,5,8,9]`, `nums2 = [2,1,4,6,9]`

Output: 1

Constraints:

- $2 \leq \text{nums1.length} \leq 10^5$
- `nums2.length == nums1.length`
- $0 \leq \text{nums1}[i], \text{nums2}[i] \leq 2 * 10^5$

Program:

```
int min(int a, int b)
{ return a < b ? a : b;
}
```

```

int minSwap(int* nums1, int nums1Size, int* nums2, int nums2Size)
{
    int keep = 0; // no swap at current position
    int swap = 1; // swap at current position

    for (int i = 1; i < nums1Size; i++)
    {
        int newKeep = 100000;
        int newSwap = 100000;

        // Case 1: no crossing
        if (nums1[i] > nums1[i - 1] && nums2[i] > nums2[i - 1])
        {
            newKeep = min(newKeep, keep);
            newSwap = min(newSwap, swap + 1);
        }

        // Case 2: crossing
        if (nums1[i] > nums2[i - 1] && nums2[i] > nums1[i - 1])
        {
            newKeep = min(newKeep, swap);
            newSwap = min(newSwap, keep + 1);
        }

        keep = newKeep;
        swap = newSwap;
    }

    return min(keep, swap);
}

```

Output:

The screenshot displays a coding problem interface with the following components:

- Problem List:** A tab at the top left.
- Description:** A section on the left containing:
 - 3 in `nums1`, length `= 3`
 - `nums1`, length `= nums1.length`
 - 3 in `nums2[1]`, `nums2[1]` `= 2 + 10`
- Advertisement:** A banner for "Mind Map every assignment" with a "Learn More" button.
- Statistics:** "Accepted: 99,702/140,116" and "Acceptance Rate: 41.5%".
- Topics:** A list of topics including "Arrays", "Sorting", "Similar Questions", and "Discussion (2)".
- Code Editor:** A central area with a "Code" tab and a "Test Result" tab. The code is in C++ and implements a sorting algorithm (likely Merge Sort).

- Test Result:** A section on the right showing the execution results for "Case 1" and "Case 2". The status is "Accepted" with a runtime of 0 ms. The input is `[1,3,5,4]` and the output is `[1,2,3,7]`.

Leetcode 1221: Split a String in Balanced Strings

Balanced strings are those that have an equal quantity of 'L' and 'R' characters. Given a balanced string s, split it into some number of substrings such that each substring is balanced. Return the maximum number of balanced strings you can obtain.

Example 1:

Input: s = "RLRRLRLRL"

Output: 4

Explanation: s can be split into "RL", "RRLL", "RL", "RL", each substring contains same number of 'L' and 'R'.

```
int balancedStringSplit(char* s)
```

```
{ int bal = 0, count = 0;
```

```
  for (int i = 0; s[i] != '\0'; i++)
```

```
    { if (s[i] == 'L')
```

```
      bal++;
```

```
    else
```

```
      bal--;
```

```
    if (bal == 0)
```

```
      count++;
```

```
  }
```

```
  return count;
```

```
}
```

Output:

Accepted Runtime: 0 ms

☒ Case 1 ☒ Case 2 ☒ Case 3

Input

s =
"RLRRLRLRL"

Output

4

Expected

4

Leetcode 322: Coin Change

You are given an integer array `coin` representing coins of different denominations and an integer `amount` representing a total amount of money.

Return the fewest number of coins that you need to make up that amount. If that amount of money cannot be made up by any combination of the coins, return -1.

You may assume that you have an infinite number of each kind of coin.

Example 1

Input: `coins = [1,2,5]`, `amount = 11`

Output: 3

Explanation: $11 = 5 + 5 + 1$

Solution:

```
int coinChange(int* coins, int coinsSize, int amount)
```

```
{ int dp[amount + 1];
```

```
for (int i = 0; i <= amount; i++)
```

```
    dp[i] = amount + 1;
```

```
dp[0] = 0;
```

```
for (int i = 1; i <= amount; i++)
```

```
{ for (int j = 0; j < coinsSize; j++)
```

```
{
```

```
    if (coins[j] <= i) {
```

```
        int curr = 1 + dp[i - coins[j]];
```

```
        if (curr < dp[i])
```

```
            dp[i] = curr;
```

```
}
```

```
    }  
}  
  
return (dp[amount] > amount) ? -1 : dp[amount];  
}
```

Output:

Leetcode 316: Remove Duplicate Letters

Given a string *s*, remove duplicate letters so that every letter appears once and only once. You must make sure your result is the smallest in lexicographical order among all possible results.

Example 1:

Input: *s* = "bcabc"

Output: "abc"

Example 2:

Input: *s* = "cbacdcbc"

Output: "acdb"

Constraints:

- $1 \leq s.length \leq 104$
- *s* consists of lowercase English letters.

Solution:

```
#include <string.h>
```

```
#include <stdbool.h>
```

```
#include <stdlib.h>
```

```
char* removeDuplicateLetters(char* s)
```

```
{ int last[26] = {0};
```

```
  bool used[26] = {false};
```

```
  int n = strlen(s);
```

```
  for (int i = 0; i < n; i++)
```

```
    { last[s[i] - 'a'] = i;
```

```
  }
```

```
  char *result = (char *)malloc((n + 1) * sizeof(char));
```

```
  int size = 0;
```

```

for (int i = 0; i < n; i++)
    { char c = s[i];
      int idx = c - 'a';

      if (used[idx])
          continue;

      while (size > 0 &&
             result[size - 1] > c &&
             last[result[size - 1] - 'a'] > i)
          { used[result[size - 1] - 'a'] =
            false; size--;
          }

      result[size++] = c;
      used[idx] = true;
    }

result[size] = '\0';
return result;
}

```

Output:
